

Create Synchronized Captioning for Multimedia Files

Hi-Caption Studio provides users with the ability to quickly and easily create, test and manage synchronized captioning for Adobe Flash® Professional 8, Windows Media Player®, RealNetworks RealOne Player® and Apple QuickTime® productions using an easy-to-use interface. The resulting captioned multimedia files fulfill both Section 508 Rule (b) and W3C WCAG 1.0 Priority 1 checkpoint 1.4 accessibility requirements which state that just providing text transcripts of multimedia files is not adequate.

Hi-Caption provides an easy-to-use tool that allows you to professionally create synchronized captioning. The captioning file is stored in a SAMI, SMIL or XML file. HiCaption allows you to easily create the formatted captioning file without having to learn the underlying code behind it, similar to a Web editing program. For Flash Professional 8 presentations, Hi-Caption Studio integrates the ability to test, remediate and caption directly within the Flash authoring tool.

With Hi-Caption, you have the option of creating the captioning text while the media file plays, or if you have a written transcript of the text, the full-featured import wizard will import the text into the program, saving you from retyping it all. These captioning files are

then used with your existing content delivery systems so end users of your media content can view closed captioning for your multimedia files.

Hi-Caption also supports captioning multimedia files in multiple languages so that the audience may select and view captioning in the language of their choice.

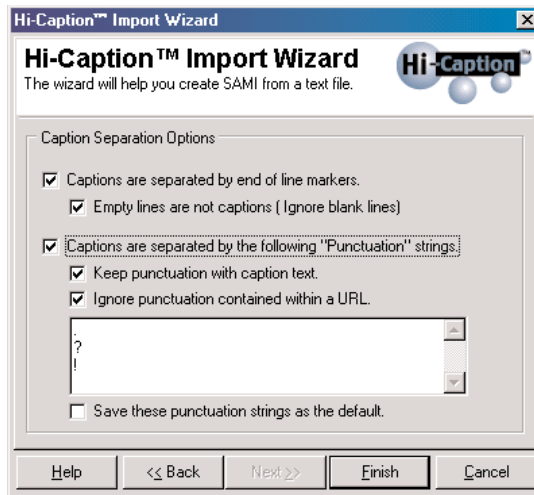

Features

- Full Support for Flash Professional 8. Includes the Hi-Caption Viewer Component for Flash and the AccRepair Component for Flash.
- Updated product interface enhanced for easier usability.
- Ability to automatically create transcripts from captioned files. This allows you to save your captioning to text, sorted by the different languages of your captioning.
- Ability to work on captioning files in collaboration with team members.
- Ability to save partially completed projects. Work does not need to be completed in one session.
- Product is localized and is available in languages other than English.
- Load existing SAMI files.
- Edit existing SAMI Files.
- Support for SMIL with RealText.
- Support for SMIL with QuickTime Text.
- Immediate testing of SAMI files as you develop.
- View videos and captions within the program, allowing you to easily create and test your captioning.
- Add multiple languages for your file at once. This allows you to easily create captioning for different languages.
- Convert seconds to milliseconds or milliseconds to seconds for easy manual editing if you desire.
- Edit in SAMI source view or Hi-Caption structure view. Just like a good HTML editor, the option exists to edit the raw code directly, if the user so chooses.
- Create SAMI files with no requirement of understanding the source.
- Automated setting of events based on usage of media player controls.

Features

- Windows Media Player 6.4 or above integrates directly into the program.
- RealPlayer 6.0 or greater integrates directly into the program.
- Edit SAMI without media attached.
- Auto Fill of parameters based on media (Duration) media name.
- Auto load of classes when SAMI File Opened.
- Advanced text transcript Import Wizard will save you time and work the way you need it to!
- Spell Check complete Transcripts.
- 100 percent configurable.

The Import Wizard allows transcripts to be loaded easily
